

"Waste Water- Acqua for All"

This is mainly intended to elaborate the main theme of "2017 World Water Day". **In 2016, the theme is "Water and Jobs," in 2017 "Wastewater" and in 2018 is "Nature-based Solutions for Water"**. This year main theme is "Wastewater" and main objective is how main planners and communities are going to maintain our wastewater to recycle, reuse and make conservation to our respective as well as globally.

At present, world underground water left is only 2.5% and human can access only less than 1%. Although global world is covered 70% by water, 99% of that water is frozen or salty so that all planners have the responsibilities to manage and alarm to our environment communities to use systematically or effectively. As of this developed and developing countries are giving health education by videos and announcement at most common places and visiting centers and locations so that visitors can disseminate those information to nearby communities.

As Myanmar is one of the global countries, we all planners as well as managers have responsibilities to consistent to global theme and objectives so that we can make conservation our environment as well as can strengthen the life expectancy of our country communities together with disseminating knowledge on importance of safe water and systematic recycle and reuse those wastewaters effectively.

In abstract, we all have to urge our planners and managers how we are marching forwards to achieve the objectives and goal of 2017 World Water Day to promote the long lives of our national communities as well as to support the global human health promotion. This is our inevitable roles and responsibilities in our lives.

With well wishes,

U Khin Maung Yi
Vice-Chairman, MES-WATSAN TD
